Maytag gemini double oven gas range manual

I enjoy working on DIY projects around my home and baking problems to solve problems. When an electric furnace does not heat, it is usually a faulty heating element. For a gas furnace, it can be the igniter furnace. When it comes to cooking a meal, your oven is the heart of the operation. In this article, I will show you what to check if your oven does not heat up. We will discuss both electric and gas furnaces. Whenever you work with electrical cables, make sure you use the correct procedure. Always consider your safety before trying a repair on a device. Before starting a project, make sure you are qualified to do so. When working with gas-powered appliances, always turn off the gas before attempting a repair. Why isn't my oven heating up to the right temperature? To determine if your oven is cooking at the right temperature, all you need to do is get a basic temperature meter that can withstand the oven temperature. Put it in the oven and set the oven to 350°F. Give yourself time to warm up and check if your oven is at the correct temperature or if it needs to be adjusted. ProblemsSix to check: Electric heating elements (oven and broiling). Sensor or bulb at electric temperature. The gas ignitor on the back of the furnace compartment. Thermostatic switch or selector. Dial calibration. 1 relay. You will need the owner's manual for the oven. A multimeter. This will allow you to conduct some simple tests. A multimeter reads both the amount of voltage and the ohms that travel through the wires. All electric furnaces have two elements. Pictured above is an item for cooking. The second item is under the oven in the brocoli compartment. 6 Reasons Your Oven Not Heat Up1. One of the heating elements is switched off When an oven does not heat, the to most likely is a faulty heating element. An electric oven has two elements, one at the top for cooking and one at the bottom for cooking. It's easy to understand when an element is burning or notA working element brilli bright red is what you do if your oven is hot, but not the correct temperature: Check the heating element you want to use. Sometimes when an oven is set to "prebake", both heating elements light up. It is possible that a functions element and the other is not. If an item does not work, you will need to replace it. If you install a new item and the oven doesn't work, you may have an electrical problem. It is here that your voltage meter will arrive at stake. You will need to test the wires that lead to the heating element connected to the heating element. There may be a bad thread or a loose connection that is causing your item not to work. Watch the illustration below for details on where to point the voltage meter. Use a voltage meter to test the threads of the terminal depicted above to determine if the item is receiving energy.2. The sensor or bulb of the oven temperature are provided by electrical ovens OUTMANY have a temperature sensor that constantly monitors the oven temperature. If the sensor becomes defective, the oven may not heat up correctly. Most sensors have a digital display on the oven. Before replacing a sensor deemed defective, be sure to check the oven elements and the wires first. You don't have a sensor Use a light bulb for temperature detection to check the oven temperature. Make sure this light bulb is not loosened or burned. The lighter is the entire unit located at the back of your gas oven. The terminals are the two wires that connect to the oven control.3. Your gas oven is switched on, your gas oven is not properly heating (or at all), check first the first light. Bring the oven from the wall and turn off the gas. The lighter will be located on the back oven compartment. Remove the ignition by lowering it from the oven. Use your multimeter to detect the continuity of power. Take a probe and place it on one terminal, then place the other probe on the second terminal. Your multimeter should register register register 0-1100 ohm. If your multimeter is not recorded in this range, your ignition has lost the continuity and needs to be replaced. You could have a faulty gas safety valve too, so to include that in your control also. 4. The thermostat or selection switch are burned outthe oven is not yet heated, check the thermostat and the selector switch. The selector is what changes the settings, like the oven or the broiler. The thermostat can be sticky or defective. 5. Your oven must be calibrated if the oven is not a correct temperature, you may need to calibrate. This can also help with ovens that work too hot. Find the calibration dial. The calibration dial is located on the back of the temperature knob or down at the bottom of the small tree. You should be able to see a adjustment screw on the dial. Regulation. This screw is where it is possible to adjust the temperature. To increase the oven temperature, turn the screw counterclockwise. To decrease the oven temperature, turn the screw counterclockwise. In most ovens, one duty should increase / decrease the oven temperature of 25 degrees. 6. Relay Bad Another problem that can prevent an oven from heating is bad relay. If your oven has two heating elements, you probably have two relays. They can burn over time. Refer to your owner's manual for the appropriate instructions, as some can request a maintenance person to resolve. This article is accurate and true for the best knowledge of the author. The content is for information or entertainment purposes and does not replace the personal council or professional consultancy in the field of business, financial, legal or technical. © 2011 Richard83 Susan Davis on 02 September 2020: I have a new stove Gas GE Convection which was in stock for 1 year up to 1 week ago. The best work perfectly. I tried to preheat the oven to 400 * and took 200 and off. Then I reappeared, he went to 207 and broke. Restarted again and presented at 243 * and turns off at 247 *. What is it My first time to use it and I have no husband to help !! Ken on July 24, 2020: my Lamona oven will not heat the oven element and the top grill elementblanch040 on April 29, 2020: my gas oven will not reach my gas oven set temp. Oven lights but simply block it In a lower temperature. The best burners work well. What should I check first? Thanksgiving April 29, 2020: I have a samsung gas oven. When I put it at any temperature, you can see it light but never comes to the set temp. What should I control.shie on January 22, 2020: Hey My Electric Inlet to listen to the house and returned to control and it was an office that didn't work. I left the best burners and an open stove to listen to the house and stopped working .Jessica on August 31, 2019: my stove has power but the upper part of the stove or the oven wants warmth what I need to check for Firstmike Woodson on 06 March 2019: I am a Maint Tech for a complex apartment. I have a resident who is saying that the oven burns the bottom of biscuits or pizza but not brown or cook the top. I don't know if this model (FEF352FWA) uses the top item during cooking, but it becomes hot red when it has passed to the broil mode. The oven cooks but I have not calibrated to see if set temps.david is obtained on November 29, 2018: I have a model of Hotpoint EW84X electric stove and the ovens, lights and the main holes, the lights and the fan plus watch will not work. Dishes all heat. Will you earn any help? Gerald Baptist November 20, 2018: My oven is becoming warm but the food is not cookingFelicia Klot Z on September 17, 2018: I can heat my oven with electric shock, then attach it to the convection and cook at 350. My oven will not come preheated. I can preheat it on a grid, but as soon as he attacked it to cook heat. But cook it on convection. Johnny the 16th September 2018: What would causes my GE Gas oven not to light up? When you try to preheate the screen starts to flash and you can smell Gasbo Young on September 8th 2018: I have power over but my broiler and the oven dose get hot but when I cut the o Broiler on it normal reading but you are not getting hot Nobody is wrong is a frigidate stuffsresnuff on August 29, 2018: I have a frigidate gas stove. I just replaced the switch on Igniter and it was still hot. Help any suggestionsSledman on August 2, 2018: Impressive feedback. Look at the work! Wednesdays on July 18, 2018: I think it was very interesting.emifer Henderson on July 16, 2018: I have the power but we don't have any heating for broiler chickens or Ovenbarry on June 8, 2018: I just replaced the oven cavity on my GE Profile Double Wall Oven. At the same time I replaced the heating element. When I tried to turn on the unit, I am receiving power; However, it does not warm up. The bottom furnace works fine. What should I check the next one? Jay'shon on May 28, 2018: When is the grill item that should heat up Upiayne Totos on May 25, 2018: Hello, I have a wall-mounted gas chef with separate grill. I just cleaned and the gas burner doesn't let the gas to heat the oven the electronic element lights up ready to light it but the burner doesn't turn on because of any gas coming in? The gas at the grill is late for a short time - more than usual.I think I can remember this happening before but I can't remember what to fix it. Someone's ideas would be greatly appreciated. Jaynedembbie Mcmillen on April 18, 2018: I have a GE profile that the Broiler works but when I try to use the oven does not get For temp remains 100 do not go up. Please help the thank you on January 12, 2018: I have a GE profile The Broiler works but when I try to use the oven does not reach temperature remains 100 do not go up. Help the Thanksgiving on January 4, 2018: Unless you are standing on your head, the top and bottom are wrong in your statement: an electric furnace has two elements, one on the top top for cooking and one on the bottom for Broiling.tina on December 30, 2017: I have an electric hotpoint stove My bottom furnace is not hot or hot My top furnace is what the cause is and if so it can be repairedDavid repairedDavid December 17, 2017 The hob works perfectly every suggestionJeff on November 28, 2017:The broiler works fine but the oven just heats up on November 15, 2017:My gas oven doesn't heat up well even the burners seem to work perfectly. Please, what do I do? Pete on November 06, 2017:My GE Electric Range Oven drove me crazy tonight. 1.) The preheating light never went out. After about 25 minutes I put my meatloaf in the oven. I kept an eye on the temperature of the meat and found that the meat was cooking at different temperatures depending on which side I put the stick on. The item was bright red, so I think it might be fine. What could cause the preheating light to not come out? Tom williams on October 23, 2017:How do I change my switch? Tammy Sutton on October 09, 2017:I have a GE gas electric furnace all of a sudden my furnace is not working my burners working what could this beNoel on October 03, 2017:I have a Samsung convection furnace that was working great then it stopped heating. We've replaced the detonator and it won't heat up yet. If you turn it on at temperature, it blinks. You can just heat up a click. Please help Bonnie on September 24, 2017:I turn on my oven on it gets to temperature and then oven turns off on its ownJean Joley on August 30, 2017:Is it possible for the oven to reach the correct temperature but not overcook the food properly in the prescribed time? The oven element and thermostat have been replaced and tests have been done to check that the oven reaches the correct temperatures but the food is not cooking fast enough. 30 min for 12 minutes scones etc. Appreciate your help on this issue. prasetio on June 14, 2017:Thank you for sharing helpful information. It helps us to use the oven properly. Have a nice day:-) Tom June 12, 2017:HiGE gas oven (about 10 yrs old) does not turn at all, but burners work well. Temporary sensor? temporary?the 13th February 2017: I accidentally touched my cooking element with a metal spatula and I saw a small spark and now both the cooking and cooking elements do not warm my oven at full temperature. Should I replace both elements or the temperature sensor or what?? Thanks! Lory on January 08th 2017: I have a gas oven running on propane. The burners upstairs are working fine. The low and high work broiler. The oven doesn't work. If I hit the preheating of the oven at 350 degrees it will show the preheating at 350 for a second or two, but then it goes to 100 degrees, but it does not illuminate or heat at all. Thanks for reading. Janice the 06 January 2017: Thanks for the article, but here is my question: Maintenance has just replaced the thermostat in my electric oven (Sears). He told me that the red outside light would come out if the cooking temperature of the oven is reached, and turn on again if the cooking temperature drops. Is that true? Martha on December 17th 2016: Thank you- this is a very useful article. Letty on December 14th 2016:Counterclockwise to decrease and in time to increase. We're all human types. Richard, if you ever see him, please settle down. Thank you very much. Luc on November 29th 2016: turn anti-clockwise to increase and disable the calibration? It can't be right, which one? Karen on 09 November 2016: I have a new Kenmore gas stove that is only two months inconsistent temps in the oven. Even the higher burners have seen inconsistencies. I can set the temperature for 375 wait for the pre-heated buzzer to say it is ready and the temperature can vary from 275 to 450 with it set for 375. What's the problem? Jao Gee on 03 November 2016: I have an electric GE stove of about 16 years (JBP66GW1WH). The lower heating element stopped working, so I replaced it. After I plugged it in, I turned on the stove to make sure He did, so I turned it off right away. Later that night I went to preheat the oven at dinner and it was cold. I baked the stove andBack, tried again, still doesn't work. Any ideas? -J.Kirstine Smith on September 17, 2016: Evening Someone please help ?? My oven worked fine, but today it didn't seem to work well. The oven light goes on and the ovens are on but it is not on Hot! Kayla on March 20, 2015: my gas oven gets hot not enough to cook other than my burners work perfectly I set it to 350 and it doesn't even go to feel more as if it were hot. My mom bought it for us and there was no owner's manual.Robrenko on 14 December 2014: GE Profile Furnace purchased on 2006. Digital display claims that Temp is 350, but is actually closer to 285. Just replaced the sensor and the problem was not solved. What else to check? DAN13R on 06 October 2014: Thank you for all the information on this page. Maybe you can offer me some guidance. I'm using a range of gases purchased around 2004. The controls are electronic (touch No dial for the oven). The oven is heated according to be irregular according to the dial thermometer. Sometimes we put it to 350 and it will heat to 400 and sometimes to 300 (if we are lucky to 350). I changed the ignition several times on this unit (for a different problem of course) and this did the trick for when it doesn't warm up at all (or only momentarily). I checked the temperature sensor with a room temperature multimeter and its reading around 1080 ohms. Any ideas? Chattypatty on May 26, 2014: I just want to say a big thank you. The oven wouldn't be heated. Called Sears, and they said I needed a sensor. Bought and installed. Still no heat. I found your site, checked again, jiggled the Lower Element and voila !! The furnace heats ... End of my problem. You're an angel. I don't know if I really needed the sensor, but since it's installed, I'm gonna put my back on the stove and say, "still" did my day. Hugs, Tony April 15th 2014: Hi, the oven is not spinning at all, but the stove floor to all burners is working well. This happened immediately after a self-cleaning. I hope it is not the control board, it could be the temperature. In February 222014:Our 12-year-old GE gas oven indicator goes out long before it reaches the right temperature. For example: if set to 400 degrees, the pre-heater switch off at 250 degrees for a decent temperature meter that I bought and put in the oven, then it takes about ten more minutes to reach 400 degrees. I know the gauge I bought is good, because it gets to 400-something and stays there after about twenty minutes. The igniter has recently been replaced and switched on within one minute; and the oven temperature sensor has just been replaced. It's the damn pager that's driving me crazy. Why would it explode at 250 with a set of 400's? Judy on December 27, 2013:I have an electric oven from Dacor that has been installed new in Feb of 08. My question is: Why? © Do foods like cookies and bread come out of the raw oven in the middle? Is there a mortgage I can use to se e if the furnace temperature is correct? Thanks! Janis on December 02, 2013 Have a range of magic chef gases; model at the end of the eighties. The pilot light is fine. The problem is, it doesn't heat up beyond 150 degrees. I have a cheesecake, probably a soft crust, waiting to be cooked. Also, I'm not sure if anyone else has brought this to your attention, but in your gas instructions, they say that turning the life thermostat knob anti-clockwise is raising and lowering the temperature. Oops! That cheesecake was a lot of work. I hate losing! Martin Brennan in June 09, 2013:Fan is cold. It's a Lamona HJA 3300. Bradley Brown from Harrow Middlesex on May 19, 2013:Hi Richard, having problems with the two stoves gas oven, the top oven is not going to temperature Is it still possible to be a stove lighter? as it only warms not hot enough. ROSEMARIA in March 2013:MY OVEN WOUNT HOLD TEMPERATUEOVEN is ELECTRIC 30 to 40 DEGR OFFnomadder on November 20, 2012: When cooking cooking do both elements get hot or just the bottom when cooking? My wife swears that both elements are turned on when you cook. Jack on November 13, 2012: "This screw is where you can adjust the temperature to. To increase the oven temperature, you can turn the screw counterclockwise. To lower the oven temperature, turn the screw counterclockwise" can't you do the same thing and get different results??? Tksunshine on November 07, 2012:Really happy I found you an article about shooting problems... to try to save money and read this article about problems that just made my day... Already replace the cooking element in the oven... it broke / scalded on I side of the element. The oven is trying to heat up now, but just not heating properly... It took 1 hour just to heat up to 215 degrees. Turn off the oven and start searching the internet for other possible causes when I came across your website. Thank God. He will try your other suggestions... Hopefully it's just loose wires...dear on July 10, 2012: I would like to know if what is the reason why the furnace of my gas range is not working properly...how do you know if the insulation of my gas range is affected? Lewis on 06 March 2012: You said to test the heating element on and electric stove... what am I checking, a healthy supply of 230v to the terminals? If I unplug the power wires what reads ohms should be expected to get? or if I'm testing the thermostat which setting on the multimeter I need it to be turned on, ohms? What is the typical value I need to know if it works well?Thanks for your time, your information is very useful only curious of the readings to know if the parts you mentioned failed if it's more of an in-depth problem Richard83 (author) from West Virginia on June 7, 2011: Hey, Prasetio! Thank you for your comments. Very much appreciated. I like to help you as happy as you liked it. Be good good From Malang-Indonesia on 05 June 2011: my brother, you also have nice and useful information. Thank you for writing this and share with us. I love cooking and always checking if something wrong happens with my gas stove. I have a simple stove. You have valuable information here, very stimulating and I think many mothers love your advice on. Keep it! Thumb up for te..prasetiorichard83 (Author) from West Virginia on May 31, 2011: Hey, Marlin! I hope all is well. This shows you that they don't do them as if they use! Marlin 55 from the United States the 4 €
